

The INTACT project addresses the schools' needs for reliable interactive teaching materials which can be used in science, mathematics and social science classrooms in bilingual educational settings.

Teaching materials are developed by educational researchers together with teachers at pilot schools following national curricula guidelines.

The materials are to be used not only with specific interactive whiteboards but with other interactive devices like tablet-PCs and smart phones.

Materials can be used for virtual cooperation scenarios connecting different classrooms all over the world via a server.

Interactive teaching materials across culture and technology
